Introduction

The EvB 4.3 is a launching set is based on two types of popular Atmel's microprocessors ATMega16 and ATMega32.

The board is equipped with a number of peripheral elements which endings are connected to the pin header that enables user to quick implementation of any project without a need to perform a dedicated board. All headers are labelled, situated near and connected close to peripherals. It enables to intuitive connection elements without a need to read the documentation.

The EvB 4.3 set has been designed both for non-experienced users who make their first steps in the world of microprocessors and for those professional programmers who search a universal platform for their projects.

Earlier versions of the EvB4.3 board were successfully applied for a number of major projects at Polish universities and during the diploma scientific researches. Nowadays our boards are in use at the universities of Silesia region.

The EvB 4.3 v4 kit

The EvB 4.3 v4 kit includes:

- Board equipped with the following units:
- AVR ATMega32 Processor with DIP40 body
- Real time clock PCF8583
- EEPROM AT24C02 memory
- TSOP4836 infra-red receiver
- DS18B20 temperature detector
- RS485 converter
- MMC/SD card socket
- 5 push buttons
- 8 LEDs
- 2 transistor outputs of 1A each
- 3 transistor outputs of 500mA each
- 2 analogue potentiometers
- 4x7 segment display
- USB port
- ISP port
- 5 pins of voltage +5V
- 5 pins of mass
- LCD of 2x16 characters
- A set of connection tools (4 single cables 10cm, one 8-line cable of 10cm

Power supply

The EvB 4.3 board may be powered by:

• USB port, use the USB-Vcc jumper,

• External AC adapter of 9V minimal voltage, to be connected with the POWER connector setting the polarisation described on the board (in this case – USB-Vcc jumper must be open).

The correct connection of the power source is signalized by a green LED situated on the GND and +5V connectors.

GND and +5V connectors are situated on the board and connected to the mass and the voltage: +5V.

Programmer's connector

At the EvB 4.3 board a 10-pin programmer's connector is set in the ISP KANDA standard. The connector is compatible with the most of programmers available at the market, including the STK200 and AVRProg.

MOSI, MISO,	ISP data way signals
SCK	

- Destination system reset RST
- NC Not connected
- Destination system VCC voltage

USB Port

Communication of the EvB 4.3 set with a PC has been designed to use a USB-UART FT232RL converter (a virtual COM port). The system FT232RL is connected to to TXD and RXD lines of the processor that leave no need for its connecting. A virtual COM port drivers are available at:

http://www.and-tech.pl/EvB4.1/CDM_2.04.06_WHQL_Certified.zip

In addition, the system FT232RL lines were derived CTS, DTR, DSR and DCD to the gold pins. These lines are used for emergency programming microprocessor but can also be used for any purpose.

RS485 Port

The EvB 4.3 board is equipped with a RS485 industrial data way enabling the board to be used in various industrial applications. Data lines (A and B) has been directed onto a terminal block situated in the left-bottom corner of the board. The 120R jumper is responsible for a connection of line terminator.

Pins RO, DI and the combined RE and DE were derived on a gold pin.

LED's

To lit a LED situated on the board you will need to connect the mass (logic zero) to its pin.

Pushbuttons

The pushbuttons situated at the board, when pressed connect their pins with the mass. To make the processor detect a pushbutton being pressed, apply a connecting pull-up resistor.

Potentiometers and Buzzer

Potentiometers situated on the board enable to generate any chosen voltage between 0 and 5V.

Buzzer will put next to the potentiometers to generate sound signals, is released after giving +5 V ba BUZ pin.

To increase the volume of the buzzer to be peeled off the white sticker placed on it.

Power outputs

The board is equipped with two outputs of 1A each (green one) and three outputs of 500mA each. The upper output marked with + is the voltage from the external power pack (if connected). Other slots of the connector are connected to the mass after 5V (logic 1) being connected with reffering outputs.

RTC clock and EEPROM memory

The board is equipped with two circuits using single data way 12C. The 2 kBits EEPROM memory (of the address 172 (0xAD) for reading and 173 (0xAC) for recording) and real time clock PCF8583 (of the address 162 (0xA2) for reading and 163 (0xA3) for recording. The PCF8583 circuit is connected with the INT pin responsible for breaks caused by alarm and a connector for battery power source for the clock. Battery can by also insert in socket on the bottom of boards.

MMC/SD card

The board is equipped with a socket for external memory cards (MMC and SD). The power source for these cards is a 3,3V stabilizer situated in the FT232RL system. The signals are adjusted to the 5V voltage by the resistor's divisors. MMc connector is connected with the socket using the following signal types CLK, DI, DATA0, DATA3 and a card entry contact.

LED display

In order to lit a display segment, forward a logic zero to the transistor's base (DIGI pins) and to the Pin responsible for the exact display's (SEGMENT pins).

LCD display

A 16-pin connector for the LCD connection based on the HD44780 controller. Because of the electric connection, the display is being controlled using 4 or 8bit words. The display signals are connected with the HD44780 connector labelled underneath. The display's contrast may be adjusted by the potentiometer (marked at the drawing below).

Jumper mark as BL enable LCD BackLight (enable by +5V).

LCD 2X16

IR receiver, temperature detector

The TSOP4836 infra-red detector's signal and the signal of the temperature detector DS18B20, are available at the connector placed above the mentioned devices. The left pin is connected with the temperature detector and the right pin is connected with the receiver.

Additional temperature detectors may also be included and connected with the connector at the left side of the detector. When installing an additional detector, it has to be turned 180 degrees against the already soldered detector (the left hand side pin is the +5V, middle one is responsible for the output signal and the one on the right hand side is the mass).

uC pins

All ports and the AREF pin (AC transducer's referential voltage) are connected to the processor's pins. All connections descriptions are available at the scheme below The RESET button placed next to the USB port is designed for a hard reset of the circuit.

EvB 4.3 v4 User's manual

www.and-tech.pl

Programming via USB.

1. First, grab a program AND-Load from the website: <u>www.and-tech.pl</u>

AND TE	CH And-Te

Before disconnecting the EVB board quit AND-Load.

Programming the AVR microprocessor with the EVB kit 4.3.

1. Connection of the microprocessor into the connector programmer.

The first step is to combine the microprocessor output with timer, as described below.

EvB	Microprocesor port ISP
TS	MISO
SR	SCK
CD	MOSI
RI	RESET

- 2. Connect the EVB 4.3 board to the computer (if the first connection of the system will ask for drivers.
- 3. Download the software from a specially prepared AVRDUDE files from the website: www.and-tech.pl/files/EvB-ISP.zip
- 4. Unpack the file and run the program avrdude-GUI.exe (requires. NET is at least version 2.0).
- 5. As a programmer choose FT232R Synchronous BitBang (EVB)

6. Select a processor that you want to set, in our case it is ATMega16

🖶 avrdude-GUI [yuki-lab.jp Ve	rsion 1.0.5]	
_avrdude.exe File		
avrdude.exe		
- Programmer FT232R Synchronous BitBang (I	EvB)	Display Window
CPort CP	vice	Command line Option
AT	mega16 (m16) 🛛 🔽	-P ft0 -B 19200

Chip Erase	Terminal	Exit

7. In the "Command line Option" type-P 19200-B ft0 Test your network connection through the Read button in the section Fuse If the windows hFuse, IFuse numbers appear it means that the programmer is working properly and we can program the processor in our file, if the screen appears as shown below, this means that the board is not properly installed on the system or poorly chosen settings.

🔛 avrdude-GUI [yuki-lab.jp Version 1.0.5] Error	X
avrdude.exe: ft0 open failed	
	<u> </u>
Close	

8. Select the file you want to upload to the processor and hit the button Erase-Write-Verify. After a few seconds, we should have a programmed microprocessor.

😸 avrdude-GUI [yuki-lab. jp	Version 1.0.5]	
_avrdude.exe File		
avrdude.exe		
Programmer FT232R Synchronous BitBar	ng (EvB)	Display Window

Read h Write Chip Erase	Read Terminal	Write Exit

The above description of the microprocessor programming can also be used for the processor is not planted in the base set of EVB, but it is in this case, remember to connect the additional power and weight to a programmable processor (the best use of pin +5 V and GND from the board EVB).

Combining sets of EVB 4.3 BASCOM Environment

Download the latest version of AND-Load v3.2 with CL from <u>http://and-tech.pl/EvB4.3/AND-Load.zip</u>

Then in the Command line, select the path to the AND-Load In the Parameters COM43 is the COM port number on which the plate is installed

On the Console I / O uncheck "Capture output?"

Then, after compiling the program to upload the program simply select the command: Tools → [WinAVR] Program

Environmental Protection

Marking by the symbol "crossed-out wheeled waste" tells about the ban on placing waste electrical and electronic equipment together with other wastes, used equipment should be collected separately. You must give used equipment to the point of collection to ensure its recycling and recovery, as the uncontrolled release into the environment of hazardous components in electrical and electronic equipment can become a source of danger to the health of humans and animals and can cause long-term adverse changes in the environment natural.
